---

Dear Hiring Manager,

I'm writing to apply for the AI Engineer position at your organization. As a recent B.E. graduate in Artificial Intelligence and Data Science, I've spent the past year building and deploying agentic AI systems end-to-end, and I'm excited about the opportunity to bring that hands-on experience to your team.

My strongest project, ResolveAI, is an enterprise agentic support copilot built with LangGraph that routes employee requests through intent classification, retrieves answers from a Pinecone-backed RAG pipeline, grades the evidence it retrieves before trusting it, falls back to web search with query rewriting when internal knowledge is insufficient, and automates support ticket creation with human-in-the-loop approval. Beyond the architecture, I deployed it live and containerized it with Docker. I've applied the same agentic, RAG-first approach in two other projects — NeuroScholar-AI, a 6-agent LangGraph platform for multi-document research with hybrid FAISS/BM25 retrieval, and ForgeBlog-AI, a multi-agent pipeline that autonomously researches, writes, and illustrates technical blog posts. All three are live and open-source.

I'm comfortable across the full stack this kind of work demands — Python, LangChain/LangGraph, vector databases, FastAPI backends, and React/Streamlit front ends — and I'm currently extending my deployment skills into CI/CD and Kubernetes to take these projects further toward production-grade infrastructure.

I'd welcome the chance to discuss how my project experience could contribute to your team.

Thank you for considering my application.

Sincerely,

Trishna Jaiswar
